Inspection of Requirements Exercise

Objectives

- > To gain experience in conducting formal inspection.
- To develop skills in detecting defects at the document level.
- > To gain experience in collection of defect and inspection data.

Preparation (individual)

- 1. Read the document (DigitalHome Software Requirements Specification version 1.2) in detail, looking for defects.
- 2. Focus on looking for defects in **Functional Requirements** (Sections 4.1, 4.2, 4.3, 4.4, 4.5)
- 3. Record the time you start reading and the time you finish, and any time for which you were interrupted on the inspection log.
- 4. Document all the issues found on the inspection log. Classify all problems as major or minor. Identify the location associated with each defect.
- 5. Make your recommendation:
 - > the document should be accepted as it is,
 - > accepted with minor changes, or
 - > major changes and an additional inspection are required.

Inspection (group)

- 1. After the preparation, you will form a team of 4-5 (reader, moderator, producer, and tester). Decide who will play which role.
- 2. Debate the correctness and quality of the document, referencing your preparation work.
- 3. All team members are responsible for pointing out possible defects in the document.
- 4. The moderator must control the meeting.
- 5. The moderator records the results. On the inspection summary form, for each defect, record who found the defect and log its location.
- 6. Calculate the metrics: yield, inspection rate, defect density, etc.
- 7. Make your recommendation:
 - > the document should be accepted as it is,
 - > accepted with minor changes, or
 - > major changes and an additional inspection are required.

Roles

Reader: the reader describes each piece of the code to the group.

Moderator: the moderator runs the meeting, helping the team to come to agreement, and records each decision or criticism once it is agreed upon.

Producer: the producer is the one who wrote the document. It is his responsibility to defend the document when another teammate brings up a potential problem that does not turn out to be a problem.

Tester: the tester focuses on problems related to correctness of the document.

Notes:

- Inspectors should not review at a very fast rate.
- Each member must record all the time spent, during the inspection process.
- Focus on identifying defects, not fixing them.
- The requirements document is a not a design specification. Check that design elements have not been added to the requirements document. However, design constraints are acceptable.

Individual Inspection Log
